Problem 1

Input	Processing	Output
quantity, price, discount_rate	Call `compute_discount(quantity, price, discount_rate)` discount_amount = quantity × price × discount_rate discounted_price = quantity × price − discount_amount Return discount_amount, discounted_price	quantity, price, discount_amount, discounted_price,

Problem 2

Input	Processing	Output
last_name, exam1, exam2, exam3,	Call `compute_scores(exam1, exam2, exam3)` total = exam1 + exam2 + exam3 average = total ÷ 3 Return total, average	last_name, total, average

Problem 3

Input	Processing	Output
last_name, sales	Call `compute_commission(sales)` If sales > 100,000: commission = sales × 0.10 Else: commission = sales × 0.05 target = sales + sales × 0.05 Return commission, target	last_name, commission, target

Problem 4

Input	Processing	Output

last_name, game1, game2, game3, handicap,	Call `compute_bowling(game1, game2, game3, handicap)` average = (game1 + game2 + game3) ÷ 3 average_with_handicap = average + handicap Return average, average_with_handicap	last_name, average, average_with_handicap,

Problem 5

Input	Processing	Output
quantity, unit_price, 	Set global total = 0, tax = 0 Call `compute_total_and_tax(quantity, unit_price)` Inside function: declare total, tax as global total = quantity × unit_price tax = total × 0.07	total, tax,
